Smart India Hackathon | Problem Statement 26262

Integrated AICTE Approval Workflow Automation, Compliance Monitoring and Alert Management System

Understanding the problem, what exists today, and the solution we propose - explained in simple words

Organization: AICTE | Department: Regulation Bureau
Category: Software | Theme: Smart Automation

Our working name for the solution: **NIGRANI** (Hindi: monitoring / supervision)

1. The whole idea on one page

Read this page first. Everything after it explains these points in detail.

The problem

AICTE approves technical colleges. Each application passes through many stages and committees, and many approvals come with conditions that have due dates (for example, a promise to recruit faculty, or a lease document that must stay valid). Today, officers have to keep chasing files, committees, colleges and documents by hand. Things get delayed, deadlines get missed, and nobody has one clear picture of what is pending where.

Our solution

NIGRANI is one secure web platform that (1) moves every application through the correct stages automatically using configurable rules, (2) treats every deadline in the system - a stage timeline, an EVC date, an undertaking, a lease expiry - as a tracked **Obligation** with an owner, a clock, reminders and escalation, and (3) shows live role-based dashboards so each officer sees exactly what needs their attention. Every action is written to a tamper-evident audit trail. Humans always take the final decisions.

What will make us stand out

- **One engine for every deadline.** Instead of building six separate trackers, we build one Obligation Engine that handles stage timelines, EVC dates, undertakings, and document validity the same way. It is simpler, easier to explain, and easier to extend.
- **Rules as settings, not code.** APH rules and timelines live in an editable, versioned rulebook. When the Handbook changes, an admin updates the rule, not the software.
- **Smart document reading.** Upload a lease deed and the system reads out the start date, end date and other key details; an officer simply confirms. This removes manual data entry and sets the expiry alerts automatically.
- **Explainable risk view.** A clear Compliance Health Score for each institution and a delay-risk flag for each case - with the reason shown, never a black box.
- **Trust by design.** Hash-chained audit trail, role and region based access, and a strict rule that automation only assists; it never replaces scrutiny, inspection or the decision of the competent authority.

> **Why this can win:** it matches every item in the problem statement and the evaluation criteria, adds a few clever but realistic features, and can be shown as a working prototype in a short demo.

2. Understanding the problem

2.1 The background, in simple words

AICTE (All India Council for Technical Education) decides which technical institutions - engineering, management, pharmacy and others - are allowed to run. A college applies on the AICTE web portal. The rules for how this works are written in the **Approval Process Handbook (APH)**, which is a legal document. The current edition covers 2024-25 to 2026-27.

Think of it like a very large courier company. Thousands of parcels (applications) travel through many checkpoints (stages). At every checkpoint, someone must act within a time limit. On top of that, some approved parcels come back with a sticky note: *'Approved, but you must do X by date Y.'* Someone has to remember to check that X was done.

2.2 The stages an application can go through

Stage	What it means in plain words
Scrutiny / Re-scrutiny	Officers or a committee check the papers the college submitted. If something is missing or wrong, the college is asked to fix it and the file is checked again.
EVC (Expert Visit Committee)	A team of experts physically visits the college to verify buildings, labs, faculty and facilities. Visits must be scheduled and completed within set timelines, especially for new institutions.
SAC / SHC	Standing Appellate Committee / Standing Hearing Committee. They hear the college's side, look at the earlier reports and recommend what should be done.
Decision	The competent authority takes the final decision, for example an Extension of Approval (EoA) or Letter of Approval (LoA). Sometimes the approval carries an **undertaking**, a promise with a deadline.

Not every application takes the same road. The problem statement lists combinations such as **Only Scrutiny**, **Scrutiny + EVC**, **EVC + SAC/SHC** and **Only EVC**, plus other combinations prescribed in the APH. The system must pick the right road automatically.

2.3 Who is involved

Person / group	What they need from the system
Institution (college)	Clear list of what is due, reminders before deadlines, an easy way to upload documents, and to see the status of its application.
Regional officer	A view of all applications and obligations in the region: what is pending, what is late, who is responsible.
Bureau / headquarters officer	A national view across regions, comparisons, bottlenecks and reports.
Committee members (Scrutiny, EVC, SAC/SHC)	Their assigned cases, deadlines, past reports, and a simple way to record observations.
Senior authorities	Escalated and overdue cases, and summary reports for decisions and accountability.
System administrator	Ability to change rules, timelines, notification templates and user roles without developers.

2.4 What goes wrong today (the pain points)

The problem statement describes these difficulties as coordination and follow-up effort across Regions and officials. We have grouped them below. Note that we have only seen AICTE's public material, not its internal systems, so these are based on the problem statement and the public process.

#	Pain point	What it leads to
1	Officers must manually monitor where each application is and how long it has been there.	Files sit idle; delays are noticed late.
2	Stage-wise pendency is hard to see across Regions, committees and institutions in one place.	Bottlenecks stay hidden; workload is uneven.
3	EVC scheduling and completion need manual follow-up.	Visits are delayed, especially for new institutions.
4	Approvals with time-bound undertakings depend on someone remembering to check.	Promises (like faculty recruitment) are not tracked to closure.
5	Lease and other documents have expiry dates that are easy to forget.	Documents expire without renewal; compliance gaps appear.
6	Reminders and communication are mostly manual (emails, circulars, calls).	Inconsistent messages, missed notices, repeated follow-ups.
7	Escalation of late cases depends on individuals noticing.	Overdue matters do not reach the right authority on time.
8	Records of who did what and when are scattered.	Weak accountability and a harder audit.

2.5 The problem statement restated

> Build one integrated, secure and configurable platform that automates approval workflows and monitors institutional compliance end to end, gives real-time dashboards, sends automatic notifications and reminders, and escalates pending or overdue actions - while keeping humans in charge of every regulatory decision.

The six things the platform must cover (from the problem statement)

Part	Requirement	In one line
A	End-to-end approval workflow automation	Route applications automatically, move them to the next stage, allow return/revert with reasons, automate routine communications.
B	Integrated dashboard and pendency monitoring	Real-time status, ageing, workload, bottlenecks, alerts, role-based views, audit trail.
C	EVC scheduling and alerts	Put applications needing EVC in the right queue, track scheduling/completion, remind and escalate.
D	Time-bound undertakings and compliance	Digital record of conditions and due dates, notify institutions, online submission, officer verification, escalation.
E	Lease and document validity	Track expiry, alert in advance, track renewal and verification, escalate if expired.
F	Notifications, escalation and reporting	Configurable alerts, automatic escalation, consolidated reports, full audit trail.

2.6 What the system must NOT do

The problem statement includes a Regulatory Safeguard. Our design follows it strictly:

- Alerts, recommendations and automated actions **support** the process. They never replace statutory scrutiny, verification, inspections or decisions that only the competent authority can take.
- Anything produced by automation (a case summary, a document reading, a risk flag) is clearly marked as a **draft for officer review**.
- Every automatic action follows a rule that an authorised person configured, and is recorded in the audit trail.

3. What exists today

3.1 AICTE's current process and tools (from public sources)

AICTE already runs its approval process through an online system. From public documents on aicte.gov.in and institution websites, we can see the following building blocks:

Existing item	What it does
AICTE Web Portal	Institutions request a user ID, log in, and submit applications for new institutions, Extension of Approval, new programs and similar requests. For 2026-27, the portal opened on 28 November 2025.
Approval Process Handbook (APH)	The legal rulebook for the whole process. The current edition covers 2024-25 to 2026-27, with amendments issued from time to time.
Online payment gateway	All approval-process payments are made online and take 48 to 72 hours to reflect in the portal.
Committee stages	Applications go through Scrutiny, Re-scrutiny, EVC and SAC/SHC. The system generates committee declarations, for example an SAC/SHC declaration showing the committee status and a recommendation such as 'Recommended for EoA with undertaking'.
Computer-generated approval letters	EoA letters (now extended for up to three years) carry conditions, such as following the undertaking or affidavit and complying with anti-ragging rules.
Circulars and notices	Schedules (for example SAC meeting schedules) and public notices are published as PDF circulars. Institutions are told to attend on given dates.
Helpline, FAQs and user manuals	Published guides explain how to apply and answer common questions, including lease-related questions such as restoration when a lease has a short validity left.

3.2 Generic tools that people usually reach for

Beyond AICTE's own portal, organisations commonly use general-purpose tools to track work. They help, but none of them is built around AICTE's rules:

Type of tool	Good at	Falls short for this problem
File-movement / e-office systems	Moving a file from one desk to another with notes.	Do not understand APH stage combinations, EVC rules, undertakings or document validity; deadlines are not tracked as first-class items.
Ticketing / SLA tools	Timers and escalation on tickets.	Not designed for multi-stage regulatory cases, committees, or institution-facing compliance submissions.
Spreadsheets and email	Quick, flexible, familiar.	Manual, error-prone, no real-time view, weak audit trail, nothing automatic.
General workflow engines (BPM)	Powerful process modelling.	Heavy to set up; need a lot of custom work to add dashboards, alerts, and compliance tracking.

3.3 The gap

The existing system gets applications **in** and generates letters **out**. What the problem statement asks for is the layer in between and after: continuous **watching**. Based on the public material and the problem statement, the gaps are:

Need	Today (as far as public information shows)	What NIGRANI adds
Automatic stage routing and next-stage movement	Stage processes exist on the portal; follow-up is coordinated by officers.	Rule-driven routing and hand-off between stages, with reasons recorded on any return.
Pendency and ageing visibility	Officers coordinate and follow up.	Live dashboards with ageing, bottlenecks and workload by region, stage and officer.
EVC scheduling alerts	Scheduling is coordinated manually.	Queue, due-date tracking, reminders, escalation and smart scheduling suggestions.
Undertaking tracking	Undertakings appear in approval/SAC records.	Each undertaking becomes a tracked obligation with due date, evidence, verification and escalation.
Lease / document expiry	Institutions must keep documents valid; reminders are not described publicly.	Automatic expiry tracking, advance alerts, renewal submission and verification.
Alerts and escalation	Circulars, email and manual follow-up.	Configurable multi-channel alerts and automatic escalation ladders.
Audit trail	Records exist across stages.	One complete, tamper-evident trail across workflow, alerts, submissions and closures.

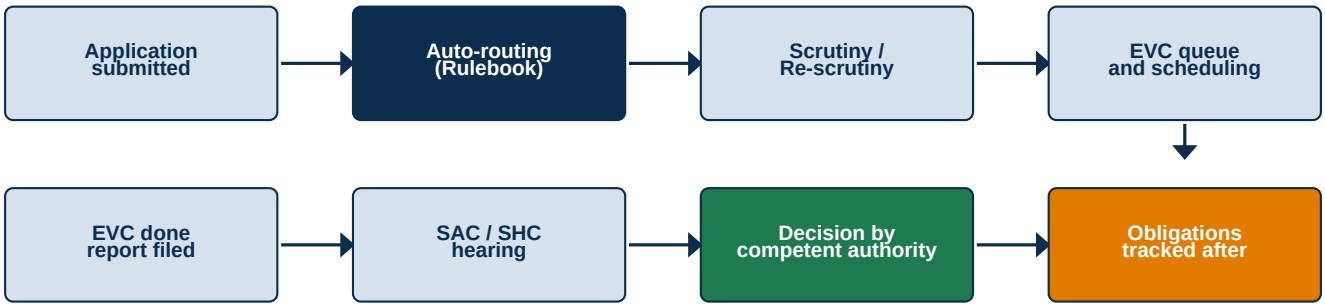
4. Our proposed solution: NIGRANI

4.1 The core idea

We build the platform around three simple building blocks:

Building block	What it is	Why it matters
1. Rulebook (Rule Engine)	A configurable set of rules: which stages apply to which type of application, how many days each stage may take, who gets notified and who gets escalated.	When the Handbook changes, an administrator edits the rule. No new software release. Rules are versioned, so we always know which rule applied to which case.
2. Workflow Engine	A state machine that moves each application through its stages (for example Scrutiny, then EVC, then SAC/SHC), and allows a return/revert with a recorded reason.	Automatic, consistent routing. The same logic for every Region.
3. Obligation Engine	Every thing that has a deadline is stored in the same shape: what is due, who owes it, due date, status, reminder plan, escalation ladder.	One engine covers stage timelines, EVC dates, undertakings and document expiry. Simple to build, simple to explain, simple to extend.

4.2 How an application travels



At every arrow the system starts a clock, records who acted, and moves the file to the next stage as soon as the previous one is complete. A return for deficiency stops the clock for the officer and starts a clock for the institution, with the reason saved. Only the applicable stages are used, so an 'Only Scrutiny' case never lands in the EVC queue.

4.3 How the six requirements are covered

Part	What NIGRANI does
A. Workflow automation	Rule-based routing for every stage combination; automatic movement on completion; authorised return/revert with mandatory reason; auto-generated standard letters and electronic case summaries (draft, for officer review).
B. Dashboards and pendency	Live dashboards by Region, stage, institution and officer; ageing buckets (for example 0-15, 16-30, 31+ days); bottleneck heat map; workload balance; role-based views; complete audit trail.
C. EVC scheduling	Cases that need EVC land in the right queue once preliminary processing ends; due-date tracking; reminders; escalation; smart scheduling suggestions that an officer approves.
D. Undertakings and compliance	Each undertaking is saved with its conditions, evidence required and due date; institution gets reminders and an upload page; officer verifies; unfulfilled items escalate.
E. Lease and documents	Expiry date stored for each prescribed document; advance alerts; renewal upload; officer verification; overdue and expired items escalate.
F. Notifications, escalation, reports	Configurable templates and channels; automatic escalation ladders; consolidated reports; full trail of alerts, submissions, verifications, escalations and closures.

4.4 Example: how the Obligation Engine handles a lease expiry

The same pattern works for an EVC due date or an undertaking. The days below are only an example; every number is a setting the administrator can change.

When	What happens	Who is told
Document uploaded	Key dates are read from the lease and shown for confirmation. Expiry obligation is created.	Institution, officer verifies
90 days before expiry	First friendly reminder: 'Your lease ends on (date). Please upload the renewed lease.'	Institution
60 and 30 days before	Second and third reminders, with a link to the upload page.	Institution (and Regional officer copy at 30 days)
7 days before	Urgent reminder. Case appears in the officer's 'due soon' list.	Institution, Regional officer
Expiry date passes	Status changes to Overdue. Case appears on the Regional dashboard in red.	Regional officer
15 days after expiry	Escalation level 1 with full history attached.	Regional head
30 days after expiry	Escalation level 2; included in the national overdue report.	Bureau officer / designated authority
Renewed document uploaded and verified	Obligation closed; new expiry obligation created; everything logged.	All concerned

Two details make this reliable: the clock uses a **working-day calendar** (holidays can be configured), and the clock **pauses** while a case is waiting on the other party after a legitimate return.

4.5 The standout features (what makes us different)

Each feature below is something we can realistically build as a software team. We also say how we will show it in the prototype.

Feature	What it does	How we demonstrate it
Unified Obligation Engine	One model for stage timelines, EVC dates, undertakings and document validity, with reminders and escalation built in.	Create four different obligations and show the same clock, alert and escalation behaviour.
Rulebook admin screen	Authorised users edit stage combinations, timelines and escalation ladders; every change is versioned and logged.	Change a timeline live and show an alert firing under the new rule.
Smart document reading	OCR plus language-model extraction pulls dates and key fields from uploaded lease deeds and certificates. An officer confirms each value. Nothing is accepted automatically.	Upload a sample lease, show extracted dates, confirm, and watch expiry alerts get created.
Compliance Health Score	A simple, rule-based score per institution from open obligations, overdue items and past behaviour. The calculation is shown in plain words.	Institution profile with score and the reasons behind it.
Delay-risk flag	An explainable model flags cases likely to cross their timeline, for example based on age, stage, region workload and past patterns. It is advisory only.	Dashboard 'at risk' list with reasons. Prototype uses realistic synthetic data.
EVC scheduling assistant	Suggests committee, dates and clustering of visits by region and availability, avoids conflicts, and an officer approves the plan.	Show a suggested schedule and approve or change it.

Feature	What it does	How we demonstrate it
Officer co-pilot (search by asking)	Ask in plain English or Hindi, for example 'EVCs pending more than 20 days in the Southern Region'. It turns the question into a safe filter limited to what that officer is allowed to see.	Type a question and get a table and a chart.
Tamper-evident audit trail	Each log entry includes a fingerprint (hash) of the previous one, so any change to history is detectable. Key actions can be digitally signed.	Show an integrity check passing, then a tampered record failing.
Multi-channel, bilingual alerts	Email, SMS and in-app (WhatsApp where permitted) in English and Hindi, with templates editable by administrators.	Receive a live alert during the demo.
Institution Compliance Wallet	A simple page for each college showing every upcoming and overdue obligation, with one-click upload.	Institution login screen with a clear 'what is due' list.

4.6 Role-based dashboards

Role	What they see first
Institution	Application status; list of upcoming and overdue obligations; upload buttons; messages from AICTE.
Regional officer	Pending cases by stage and age; EVCs due; undertakings and documents falling due or overdue; items needing action today; officer-wise workload.
Bureau officer	National view by Region and stage; bottleneck map; Region-wise performance comparison; top overdue categories.
Committee member	Assigned cases, visit or hearing dates, past reports for the case, a form to record observations.
Senior authority	Escalated cases only, summary numbers, trend lines and downloadable reports.
Administrator	Rulebook, timelines, templates, users, roles, integration status and audit integrity checks.

4.7 Reports

One-click, exportable reports (PDF and Excel) for: application pendency, EVC status, undertaking compliance, document validity, overdue cases, and Region-wise processing performance - as listed in the problem statement.

4.8 Security and trust

- **Role- and region-based access:** a Regional officer sees only the cases they are allowed to see.
- **Secure login:** multi-factor authentication for officials; sessions and tokens managed through a standard identity service.
- **Data protection:** encryption in transit and at rest; encrypted document storage; careful handling of personal data in line with India's data protection law.
- **Traceability:** every view-changing action is logged with who, what, when and why.
- **Human oversight:** the system recommends and reminds; people verify and decide.
- **Hosting:** designed to run on government-approved cloud or on-premise infrastructure, with standard government security and accessibility practices in mind.

4.9 Working with AICTE's existing systems

The problem statement asks for integration with existing authorised systems wherever feasible. We design an **integration layer** with clean connectors, so the platform can sit beside the current portal rather than replace it:

- **Inbound:** read application, stage and committee data through APIs or scheduled data exchange (in the prototype, we simulate this with sample data).
- **Outbound:** send notifications through authorised email and SMS gateways.
- **Optional:** document verification through DigiLocker and electronic signing where available.
- Because the real portal's interfaces are not public, we describe these as adapters and clearly mark them as 'to be finalised with AICTE'.

4.10 Technical design

We use proven, open-source tools so the team can build quickly and AICTE can run it without licence worries.

Users	Institutions | Regional officers | Bureau officers | Committees | Senior authorities | Admin
Front end	React / Next.js web app (responsive, English and Hindi, accessible); charts with ECharts or Recharts
API and services	FastAPI (Python) services: Workflow Engine, Rule Engine, Obligation Engine, Notification Service, Reporting, Co-pilot, Document Intelligence
Background jobs	Scheduler and worker queue (Celery with Redis) for reminders, escalations, daily checks and report generation
Data	PostgreSQL (cases, rules, obligations, audit log) | Object storage such as MinIO (documents) | Redis (cache and queues)
Security	Keycloak for login and roles | encrypted storage | hash-chained audit log
Integrations	Connectors to AICTE portal data | Email / SMS gateways | DigiLocker (optional) | e-Sign (optional)
Delivery	Docker containers, deployable on Kubernetes or plain servers; logs and monitoring with Prometheus and Grafana

Key design choices

- **Rules in the database, not in code** - each rule has a version and an effective date.
- **Event-driven:** every change (stage completed, document uploaded) creates an event; the Obligation Engine reacts to events and schedules the next reminder.
- **Idempotent alerts:** the same reminder never goes out twice, and a missed run is caught up on restart.
- **Explainable AI only:** where we use models (document reading, risk flags, co-pilot), outputs carry reasons and a confidence level, and always go through human review.

5. The prototype and how it is judged

5.1 Demo story (about 4 to 5 minutes)

Step	What we show	What the judges see
1	A new application is submitted. The Rulebook picks its route (for example Scrutiny + EVC).	Automated routing
2	Scrutiny completes; the case moves to the EVC queue on its own. One case is returned for a deficiency with a reason.	Next-stage movement, return/revert, audit trail
3	The dashboard shows ageing, bottlenecks and an EVC due-soon list; a late EVC escalates to the designated authority.	Pendency monitoring, EVC alerts, escalation
4	An approval with an undertaking is opened; the institution uploads evidence; the officer verifies it.	Undertaking tracking, compliance submission
5	A lease deed is uploaded; dates are extracted and confirmed; expiry alerts appear; one overdue lease escalates.	Lease and document expiry monitoring
6	We ask the co-pilot a question, then open the reports and run the audit integrity check.	Reports, trail completeness, trust

5.2 How we match the evaluation criteria

Criterion in the problem statement	How NIGRANI answers it
Workflow accuracy	Rules are tested for every stage combination (automated tests); the workflow only allows valid transitions.
Timeliness of alerts	Scheduler with catch-up and a visible 'alert log' showing planned versus sent time.
Reliability of deadline tracking	Working-day calendar, clock pauses, idempotent jobs and a daily self-check.
Visibility of pending cases	Live role-based dashboards, ageing buckets, bottleneck map, at-risk list.
Reduction in manual follow-up	Automatic reminders and escalation; we can show a counter of follow-ups the system handled.
Completeness of digital audit trail	Hash-chained log of every movement, alert, submission, verification, escalation and closure.

6. Is this realistic to build?

Yes. We split the work by importance so that a strong core is always ready, and extras are added if time allows.

Priority	Feature	Effort	Notes
Must have	Workflow engine with stage combinations and return/revert	Medium	State machine plus rules table.
Must have	Obligation Engine with reminders and escalation	Medium	Scheduler plus working-day calendar.
Must have	Role-based dashboards and pendency views	Medium	Charts and filters on one database.
Must have	Undertaking and lease/document tracking with upload and verification	Medium	Reuses the Obligation Engine.
Must have	Audit trail (hash-chained) and reports	Low to medium	Append-only table plus export.
Should have	Rulebook admin screen	Low to medium	Forms over the rules table.
Should have	Document reading (OCR and extraction)	Medium	Open-source OCR plus language model, officer confirms.
Should have	Bilingual alerts (email, SMS)	Low	Templates and a gateway sandbox.
Nice to have	EVC scheduling assistant	Medium	Simple optimisation with constraints.
Nice to have	Compliance Health Score and delay-risk flag	Low to medium	Rule-based score; simple explainable model on synthetic data.
Nice to have	Officer co-pilot	Medium	Question to safe, role-limited filter.

6.1 Honest limits and how we handle them

Challenge	How we handle it
We do not have access to AICTE's real data or internal interfaces.	Prototype uses realistic synthetic data and clearly defined adapters; we explain the integration plan.
Exact APH timelines vary by case type and edition.	All timelines are settings; we load examples and show how an admin changes them.
AI can be wrong (for example misreading a scan).	Every AI output is a draft with a confidence level; an officer confirms before anything is saved as fact.
Alerts could be missed if a server is down.	Catch-up jobs on restart, retry logic, and an alert log for checking.
Officers may resist a new tool.	It sits beside the current portal, reduces their chasing work, and keeps them in control of decisions.

7. Expected benefits

Outcome in the problem statement	How we would measure it
Less repetitive manual work and follow-up	Number of reminders and escalations sent automatically; officer time saved.
Faster, more transparent processing	Average days per stage before and after; share of cases within timeline.
Better monitoring of pendency and EVC scheduling	Count of cases at risk; EVC completion within timeline.
Timely undertakings and compliance	Percentage of undertakings closed on time.
Fewer missed deadlines and expired documents	Number of expired documents; days-to-renewal.
Stronger accountability	Audit completeness; escalations resolved within target.
Better use of administrative resources	Workload balance across officers and Regions.

8. Suggested outline for the PPT round

A short, clear deck usually wins over a long one. Here is a 12-slide structure that uses this document:

Slide	Title	Key content
1	Title	PS number, team name, solution name, one-line promise.
2	The problem	Manual follow-up across stages, EVC, undertakings and documents; consequences.
3	Who is affected	Institutions, Regional and Bureau officers, committees, senior authorities.
4	What exists today	Portal, APH, circulars, letters; generic tools; the gap.
5	Our idea	Rulebook + Workflow + Obligation Engine = NIGRANI.
6	How it works	The workflow diagram and the lease-expiry example.
7	Standout features	Document reading, risk flags, scheduling assistant, co-pilot, audit trail.
8	Dashboards and reports	Mock screens for each role.
9	Architecture and tech stack	The layered diagram.
10	Security, safeguards, integration	Human oversight, access control, adapters.
11	Prototype and roadmap	Demo flow and the priority plan.

Slide	Title	Key content
12	Impact	Outcomes and how we measure them; closing line.

9. Words used in this document

Term	Meaning
AICTE	All India Council for Technical Education.
APH	Approval Process Handbook - the legal rulebook for approvals.
EoA / LoA	Extension of Approval / Letter of Approval.
EVC	Expert Visit Committee - experts who visit a college to verify facilities.
SAC / SHC	Standing Appellate Committee / Standing Hearing Committee.
Undertaking	A written promise by a college to fulfil a condition by a due date.
Obligation	Our name for anything with a deadline and an owner (stage timeline, EVC date, undertaking, document expiry).
Escalation	Automatically sending an overdue item to a higher authority.
Audit trail	A permanent record of who did what and when.
Hash-chained log	A log where each entry carries a fingerprint of the previous one, so tampering can be detected.
OCR	Software that reads text from scanned pages and images.

10. Sources

Information about the current AICTE process comes from public AICTE documents and institution-hosted copies of AICTE-generated documents. We have not seen AICTE's internal systems.
